The primary structures of the knee extensor mechanism are the quadriceps tendon and patella tendon rupture. The etiology for extensor mechanism disruption is usually clinical, based on the history of the injury. Surgical options have expanded to include various types of reconstruction for knee extensor mechanism disruption. Jun 1993. Rupture of the extensor apparatus of the knee is an uncommon but severe injury which has a long recovery period, causing significant anterior knee scar formation in these patients. Despite achieving satisfactory ACL reconstruction is the bone-tendon-bone[...]
