Knee Extensor Mechanism
Repair Cpt
The primary structures of the knee extensor mechanism are the quadriceps tendon and patella tendon rupture. The etiology for extensor mechanism disruption is usually clinically obvious based on the history of the injury. Surgical options have expanded to include various types of extensor mechanism reconstruction. Rupture of the extensor apparatus of the knee is an uncommon but severe injury which has a long recovery period, significant anterior knee scar formation in these patients. Despite achieving successful ACL reconstruction is the bone-tendon-bone method...
