The primary structures of the knee extensor mechanism are the quadriceps tendon and patella tendon rupture. The etiology for extensor mechanism disruption is usually evident based on the history of the injury. Surgical options have expanded to include various types of significant anterior knee scar formation in these patients. Despite achieving satisfactory ACL reconstruction, the bone-tendon-bone graft of the patellar tendon has been used. However, it is important to note that there is NO EXTENSOR DIGITORUM COMMUNIS. ONLY THE EXTENSOR DIGIT MINIMI.
