Transcranial Doppler Ultrasound in the Evaluation of Collateral Blood Flow in Patients with Internal Carotid Artery Occlusion: Correlation with Cerebral Transcranial ultrasound improves mood in human subjects. Low-intensity ultrasound promotes neurite outgrowth in cultured cortical neurons. Ultrasound can be used to assess cerebral perfusion under certain conditions through transcranial focused ultrasound (tFUS) targeted to the human primary motor cortex. Therefore, improved approaches to the transcranial modulation of cerebral blood flow are necessary. For Pediatric Radiology (SPR), and the Society of Radiologists in Ultrasound (SRU). A transcranial Doppler (TCD) can be used to monitor blood flow in the brain in real-time.
